

AddSecure Link

IoT made easy and secure with scalable solutions designed to fit your needs.

Scale as needed with AddSecure Link

AddSecure Link is a cellular and VPN connectivity solution for large customers and IoT system integrators. Create a secure and private cloud and manage your customers' SIM cards in our platform for 2G, 3G, 4G, Narrow Band and LTE-M coverage with multiple carrier support across Europe.

Link provides a complete communication infrastructure for SIM cards, remote access and monitoring of Secure Critical Communications to installations in all types of environments.

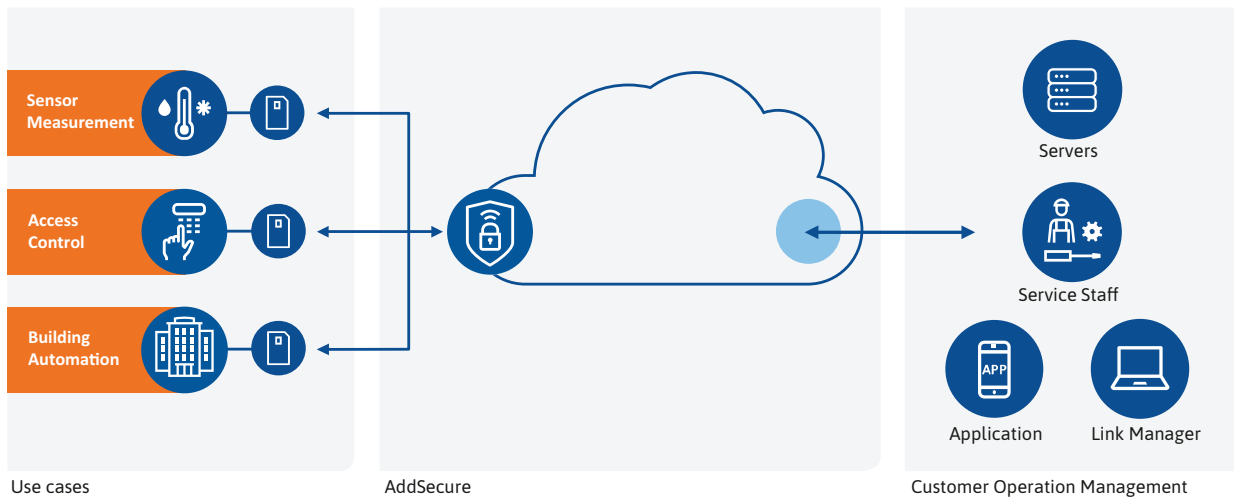

AddSecure Link is created for customers, or application providers with customers, who need effective, secure and robust communications between equipment and facilities that are far away, and who does not want to manage the complex technology behind secure communications.

Private Networks

One of the challenges of creating an IoT solution is security. Adding layers of security as an afterthought can prove difficult AddSecure Link makes it easy from start to create a complete private network (VPN) in minutes, encompassing all devices and systems that are supposed to communicate. The network is completely isolated from other internet traffic and closed for unauthorized users and devices. Multiple private networks can be created and managed to cater for separation of a partner's different end customers, or separation of different types of traffic and systems.

The Link Manager web portal

In the web portal, Link Manager, all the tools necessary to establish and manage your network and connections are available.

The example shows plants, all of which have a varying set of security systems and other technical equipment connected through AddSecure Link.

The user interface is intuitive, with clear guidance, and utilizes a high level of automation, limiting the risk of human errors and thereby increasing security in the deployed solutions.

quick creation of a secure connection between local devices and centrally installed systems.

- Easy to manage – one tool for SIM-cards, data traffic management, and network management. A more complete view than standard SIM management tools.
- Full control – the overview in Link Manager provides possibilities to follow up on cost and data volumes. Setting a fixed data limit per device is easy, ensuring full cost control and no surprises.
- Scalable – Possibility to set up networks and connections, order new SIM-cards and VPN-certificates, available at your fingertips.

Plug-n-play with Link Go

Link Go is a plug-n-play solution for companies that want a quick and easy start in connected devices and systems. Common areas for Link Go is access control system, alarm systems, management of elevators, cameras and other remote control needs. Link Go comprises a secure encrypted connection, with a robust and reliable router as an option. Link Go is easy to deploy and is delivered as a pre-activated SIM-card and VPN-access. Perfect for the

Features

Easy to administrate

A high level of automation makes complex IP technology available to everyone.

Scalable

Scales your private networks when needs are changing.

Efficient and environmentally sound

So easy to manage that it actually gets used, on site visits may be a thing of the past.

Full control

Provides a quick and clear overview of all connections and connected devices.

Secure connections

Invisible and with no leaks.
